

09/669,847
DOCKET NO. FQ5-488

12

REMARKS

Claims 1, 4-11, 13-27, and 29-30 are all the claims presently pending in the application. Claims 1, 8, 11, 18-21, 23, 25-27, and 29 are amended to more clearly define the invention and claim 28 is canceled. Claims 1, 8, 11, 18-21, 23, and 25-27 are independent.

These amendments are made only to more particularly point out the invention for the Examiner and not for narrowing the scope of the claims or for any reason related to a statutory requirement for patentability.

Applicant also notes that, notwithstanding any claim amendments herein or later during prosecution, Applicant's intent is to encompass equivalents of all claim elements.

Entry of this §1.116 Amendment is proper. Since the Amendments above narrow the issues for appeal and since such features and their distinctions over the prior art of record were discussed earlier, such amendments do not raise a new issue requiring a further search and/or consideration by the Examiner. As such, entry of this Amendment is believed proper and Applicant earnestly solicits entry. No new matter has been added.

Claims 1, 4-7, 15, 18, 21-22, and 25 stand rejected under 35 U.S.C. § 102(b) as being anticipated by the Nazanin et al. reference. Claims 8-10, 16, 19, and 26 stand rejected under 35 U.S.C. § 103(a) as being unpatentable over the Nazanin et al. reference in view of the Smith reference. Claims 11, 13-14, 17, 20, 23-24, and 27 stand rejected under 35 U.S.C. § 103(a) as being unpatentable over the Nazanin et al. reference in view of the Groff reference.

These rejections are respectfully traversed in the following discussion.

I. THE CLAIMED INVENTION

An exemplary embodiment of the claimed invention, as defined, for example, by

09/669,847
DOCKET NO. FQ5-488

13

independent claim 1, is directed to an alert control method in a mobile telephone equipment having an alert function. The method includes storing a last-communication time related to a name of a person in a phonebook database in a mobile telephone equipment, calculating an amount of time that has elapsed since the last-communication time, comparing the amount of time that has elapsed since the last-communication time to a predetermined time interval, and alerting when the predetermined time interval is less than the amount of time since the last-communication time.

A second exemplary embodiment of the claimed invention, as defined, for example, by independent claim 18, is directed to a mobile telephone having an alert function. The mobile telephone includes a phonebook database in the mobile telephone apparatus for storing a last-communication time related to a name of a person, and a controller for calculating an amount of time since the last-communication time, comparing the amount of time since the last-communication time to a predetermined time interval, and starting the alert function when the predetermined time interval is less than the amount of time since the last-communication time.

While some conventional mobile telephones store a communication history of calls that are received from and placed to a particular person, if a user forgets to check the communication history, then a person who has called the user might not receive a reply from the user.

Another conventional telephone system includes a voice mail system that records the time that a person left a voice mail, and the system determines whether a predetermined period of time has elapsed since the voice mail was received and provides an alert if communication with the person that left the voice mail has not been established within the

09/669,847
DOCKET NO. FQ5-488

14

predetermined period of time. However, using this conventional telephone system, a user can only be alerted about an incoming call.

An important feature of the present invention is for a mobile telephone to make an alert when a predetermined time interval has elapsed since the last-communication time with that person. Since the alert is made by the mobile telephone when the predetermined time interval has elapsed without communicating with the person, the communication can be ensured without checking the calling or called history.

Further, in stark contrast with the conventional mobile telephones, the present invention stores data regarding the last-communication with a person and then determines whether a predetermined time has elapsed since the last-communication with that person. This feature is important for determining whether a predetermined time interval has passed since that last talk with that person and providing an alert on the mobile telephone when that predetermined time interval has been exceeded. In this manner, the mobile telephone of the present invention ensures that a user is able to maintain periodic communication with a person.

A feature of claims 8 and 19 is that a plurality of persons are divided into a plurality of groups in the phone book database in the mobile telephone and a before-alert time period is determined for each group. Accordingly, a before-alert time period can be automatically determined for all persons belonging in the same group, resulting in enhanced operability.

A feature of claims 11 and 20 is that an alert-inhibition time period during which alert by the mobile telephone is inhibited is stored and, when a current time of day falls into the alert-inhibition time period, alert by the mobile telephone is inhibited. Accordingly, a beeper sound or vibration by the mobile telephone is prevented from annoying people around the

09/669,847
DOCKET NO. FQ5-488

15

mobile telephone in conference or if it is realized that the person being called would not want to be called, for example, when that person is asleep.

II. THE PRIOR ART REJECTIONS

A. The Examiner's Response to Arguments

The Examiner requests that the Applicant show the "exact manner" in which the elapsed time is compared to the predetermined time interval. In this respect, the specification at, for example, page 14, line 9 through page 16, line 3 illustrates one exemplary method for determining whether the elapsed time exceeds the predetermined time interval with reference to Figure 3 and includes a specific example.

In particular, this exemplary embodiment:

- 1) "reads the current time of day from the timer 80 (step 303)";
- 2) "reads the last-access time of day when last communicated with the person of a selected entry from the phonebook database 110 (step 304)";
- 3) "calculates the time period of silence elapsed after the last-access time of day (step 305)"; and
- 4) "determines whether the elapsed time exceeds the before-alert time interval that has been set." (Page 14, line 21 - page 15, line 4).

The specification further describes a specific application of this exemplary embodiment where:

"the control section 10 reads the current time of day from the timer 80 at step 303 . . . the current time of day is 1999/06/01/10:06 . . . the control section 10 reads the last-access time of day with 'Suzuki Ichiro' from the

09/669,847
DOCKET NO. FQ5-488

16

phonebook database 110 at step 304. Here, the last-access time of day with 'Suzuki Ichiro' is 1999/05/31/19:05. Therefore, the time period of silence elapsed after the last-access time of day is 15 hours and 1 minute." (Page 15, lines 15 - 23).

This Amendment amends the independent claims to clarify that: 1) the amount of time that has elapsed is calculated; and 2) the amount of time that has elapsed is compared to the predetermined time interval.

An exemplary embodiment of the present invention calculates an amount of time that has elapsed since the last-communication time. In this specific exemplary embodiment, one of ordinary skill in the art understands that the calculation of the amount of time that has elapsed is performed by determining the difference between the last-access time of day to the current time of day. Thus, this exemplary embodiment clearly calculates an amount of time that has elapsed.

In this regard, the Examiner alleges that the Nazanin et al. reference "calculates an amount of time that has elapsed since the last communication time."

In particular, the Examiner alleges that the disclosure by the Nazanin et al. reference of using a "previously set time/date in relation to the current time/date is the mechanism by which the phone calculates an amount of time that has elapsed."

However, contrary to the Examiner's allegation the Nazanin et al. reference merely discloses comparing an alert time to the current time. The Nazanin et al. reference does not calculate how much time has elapsed at all. The comparison of the two times merely determines whether a previously entered time interval has passed.

For example, if the current time was sooner than the alert time, then the system

09/669,847
DOCKET NO. FQ5-488

17

disclosed by the Nazanin et al. reference would merely confirm that the alert time had not yet been reached. The system disclosed by the Nazanin et al. reference does not calculate an amount of time that has elapsed at all.

Moreover, in stark contrast to the Examiner's allegation, and, the Nazanin et al. reference does not calculate any time interval at all.

Rather, the Nazanin et al. reference receives a time duration as input from a user.

Indeed, the Examiner admits that the Nazanin et al. reference discloses that the time duration is "entered as a time duration."

There is a clear distinction between calculating a time interval and receiving that time interval as an entry.

The independent claims as clarified by the present Amendment each recite calculating an amount of time and the Nazanin et al. reference discloses receiving a time interval as an entry.

Further, the Examiner alleges that the Nazanin et al. reference discloses that "the predetermined time interval is compared to the absolute 'last communication time' and stored as an absolute 'future time' that is compared to the absolute 'current time.'"

This allegation by the Examiner is only partially correct.

The Examiner is correct that the Nazanin et al. reference discloses comparing the "absolute 'future time'" to the "absolute 'current time.'"

However, the Examiner is not correct with respect to the allegation that the Nazanin et al. reference discloses that "the predetermined time interval is compared to the absolute 'last communication time.'"

Rather, as explained previously, the Nazanin et al. reference discloses that the

09/669,847
DOCKET NO. FQ5-488

18

operator may enter a period of time, and that the entered period of time is "converted to an hour and minute format." (Emphasis added, col. 3, lines 63-66) based upon the current time when that period of time is entered.

One of ordinary skill in the art understands that the "conversion" that the Nazanin et al. reference performs must be done by adding the entered period of time to the time at which that period of time is entered. In other words, rather than disclosing a comparison between time intervals, the Nazanin et al. reference clearly only discloses adding the entered period of to the time at which that period is entered.

Further, the Nazanin et al. reference does not even disclose converting the period of time based upon a last communication time. Rather, the Nazanin et al. reference discloses converting based upon the time that the period of time is entered.

Additionally, the Examiner appears to not appreciate the distinction between a predetermined time interval and an amount of time since last communication.

In this regard, the Examiner refers to the Nazanin et al. reference disclosure of an entered period of time and then alleges that this entered period of time corresponds to both 1) the predetermined time interval; and 2) the amount of time since last communication.

The Nazanin et al. reference clearly only discloses a single instance of processing being performed based upon any time interval at all. Specifically, the Nazanin et al. reference clearly only discloses receiving a period of time that is entered by a user and then determining a future (alert) time by adding that entered period of time to the time at which the period of time was entered.

In stark contrast, the independent claims recite 1) a predetermined time interval, and 2) an amount of time since last communication. The Examiner cannot reasonably allege that

09/669,847
DOCKET NO. FQ5-488

19

the Nazanin et al. reference's disclosure of an entry of a period of time by a user corresponds to both of the time intervals that are recited by the independent claims.

Further, since the Nazanin et al. reference only discloses a single entry a time interval, the Nazanin et al. reference clearly does not disclose comparing that time interval to another time interval.

Moreover, the Nazanin et al. reference clearly does not disclose alerting when a predetermined time interval is less than the calculated amount of time.

Applicant respectfully submits that the Nazanin et al. reference does not teach or suggest the features of the independent claims as amended above including: 1) calculating an amount of time that has elapsed since a last-communication time; 2) comparing the amount of time that has elapsed since the last communication time to a predetermined time interval; and 3) alerting when the predetermined time interval is less than the amount of time since the last-communication time.

B. The Nazanin et al. reference

Regarding the rejection of claims 1, 4-7, 15, 18, 21-22, and 25, the Examiner continues to allege that the Nazanin et al. reference teaches the claimed invention. Applicant submits, however, that there are elements of the claimed invention which are neither taught nor suggested by the Nazanin et al. reference.

As explained above and previously, the Nazanin et al. reference discloses comparing a current time with a specified time and does not make any comparison at all between intervals of time and/or periods of time.

The Nazanin et al. reference clearly does not teach or suggest the features of the

09/669,847
DOCKET NO. FQ5-488

20

present invention including: 1) calculating an amount of time that has elapsed since the last-communication time, (claims 1, 8, 11, 21, and 23) and 2) comparing an amount of time that has elapsed since a last-communication time to a predetermined time interval (claims 1, 8, 11, 18-21, 23, and 25-27).

The Examiner continues to allege that the Nazanin et al. reference discloses that a “previously set time/date in relation to the current time/date is the mechanism by which the phone calculates an amount of time that has elapsed since the last communication time.” (Emphasis added).

However, as explained above, the Nazanin et al. reference: 1) never calculates any amount of time at all, let alone whether an amount of time exceeds a predetermined amount of time; 2) clearly does not disclose comparing periods of time at all, rather, the Nazanin et al. reference only discloses comparing a specific time with a current time.

These distinctions that the present invention has over the Nazanin et al. reference are important because the Nazanin et al. reference clearly suffers from the limitation that specific times are compared, and there is no disclosure of comparing any elapsed period of time with a predetermined period of time.

Therefore, the Nazanin et al. reference requires either that the user always enter a specific time at which the user wants the device to alert the user OR to enter an amount of time after the current time that the user wants the device to alert the user. In other words, the device that is disclosed by the Nazanin et al. reference is cumbersome because either a specific time and/or period of time must be entered after every call.

In stark contrast, an exemplary embodiment of the present invention is capable of handling a predetermined period of time and, is therefore, capable of calculating the amount

09/669,847
DOCKET NO. FQ5-488

21

of time that has elapsed after the last-communication time and whether that amount of time exceeds the predetermined period of time without requiring any determination from the user of a specific time or any amount of time that is specific only for a specific instance of a call. In other words, the user of an exemplary embodiment of the invention merely needs to enter a predetermined period of time and the device will automatically determine when that time period has been exceeded for every call and not merely for a specific instance of a call.

Therefore, the Nazanin et al. reference does not teach or suggest each and every element of the claimed invention and the Examiner is respectfully requested to withdraw this rejection of claims 1, 4-7, 15, 18, 21-22, and 25.

C. The Nazanin et al. reference in view of the Smith reference

Regarding claims 8-10, 16, 19, and 26, the Examiner continues to allege that the Smith reference would have been combined with the Nazanin et al. reference to form the claimed invention. Applicant submits, however, that these references would not have been combined and even if combined, the combination would not teach or suggest each and every element of the claimed invention.

Applicant submits that these references would not have been combined as alleged by the Examiner. Indeed, the references are directed to completely different matters and problems.

Specifically, the Nazanin et al. reference is directed to providing a telephone that alerts a user at a preprogrammed time to place a call, and allows the user to automatically dial the call by pressing "CONFIRM." (Col. 1, lines 33-35).

In stark contrast, the Smith reference is specifically directed to an automated

09/669,847
DOCKET NO. FQ5-488

22

telephone dialing equipment which addresses the problems of prioritizing calls so that the number of connecting calls remains fairly constant, providing enough calls to keep agents busy, but which also allows individual call records to be dialed at more appropriate times for the called party based upon experience, call history, or other similar criteria (col. 2, lines 48-54).

One of ordinary skill in the art who was concerned with providing a telephone that alerts a user at a preprogrammed time to place a call to a specific individual, and allows the user to automatically dial the number by pressing "CONFIRM", as the Nazanin et al. reference is concerned with, providing would not have been motivated to refer to the Smith reference because the Smith reference is directed to the completely different and unrelated problem of prioritizing calls for an automated telephone dialing equipment.

Indeed, the Nazanin et al. reference has absolutely nothing to do with automated telephone dialers, let alone prioritizing calls for an automated telephone dialer.

Thus, the references would not have been combined.

Further, Applicant submits that the Examiner can point to no motivation or suggestion in the references to urge the combination as alleged by the Examiner.

The Examiner alleges that it would have been obvious to modify the telephone that is disclosed by the Nazanin et al. reference based upon the disclosure of the automated telephone dialing equipment that is disclosed by the Smith reference to divide the plurality of persons into groups "because this would gives (sic) the system the advantage of being able to process the grouped users in a batch and enter account records (such as the before-alert time interval) much more efficiently."

However, the Examiner admits that the Nazanin et al. reference does not teach or

09/669,847
DOCKET NO. FQ5-488

23

suggest dividing a plurality of persons into a plurality of groups and determining a before-alert time interval.

While the Examiner alleges the Smith reference discloses grouping customer records together into campaigns at col. 1, lines 11-36, the Examiner does not provide any reference which discloses determining a before-alert time interval.

Indeed, as previously explained, the Smith reference discloses a system in which a lot of customers are grouped and a call to each customer is automatically made. Therefore, it is completely different from claim 8 which recites that a before-alert time period is determined for each group.

Further, the Smith reference does not disclose determining whether the before-alert time interval has elapsed after the last-communication time of day.

Moreover, even assuming arguendo that one of ordinary skill in the art would have been motivated to combine these references, the combination would not teach or suggest each and every element of the claimed invention.

As explained above, the Nazanin et al. reference does not teach or suggest the features of the present invention including: 1) calculating an amount of time that has elapsed since the last-communication time, (claims 1, 8, 11, 21, and 23) and 2) comparing an amount of time that has elapsed since a last-communication time to a predetermined time interval (claims 1, 8, 11, 18-21, 23, and 25-27).

The Smith reference does not remedy these deficiencies.

Therefore, the Examiner is respectfully requested to withdraw the rejection of claims 8-10, 16, 19, and 26.

09/669,847
DOCKET NO. FQ5-488

24

D. The Nazanin et al. reference in view of the Groff reference

Regarding claims 11, 13-14, 17, 20, 23-24, and 27, the Examiner continues to allege that the Groff reference would have been combined with the Nazanin et al. reference to form the claimed invention. Applicant submits, however, that these references would not have been combined and even if combined, the combination would not teach or suggest each and every element of the claimed invention.

Applicant submits that these references would not have been combined as alleged by the Examiner. Indeed, the references are directed to completely different and unrelated matters and problems.

Specifically, the Nazanin et al. reference is directed to providing a telephone that alerts a user at a preprogrammed time to place a call, and allows the user to automatically place the call. (Col. 1, lines 33-35).

In stark contrast, the Groff reference is specifically directed to a timed telephone ring silencer that allows a user to selectively disable the ringer mechanism of a telephone attached to the silencer device for a predetermined time interval (col. 1, lines 46-51).

One of ordinary skill in the art who was concerned with providing a telephone that alerts a user at a preprogrammed time to place a call, and allows the user to automatically place the call as the Nazanin et al. reference is concerned with solving, would not have referred to the Groff reference because the Groff reference is directed to the completely different and unrelated problem of selectively disabling the ringer mechanism of a telephone attached to the silencer device for a predetermined time interval.

Further, the Examiner's alleged modification would render the invention that is disclosed by the Nazanin et al. reference unsatisfactory for its intended purpose.

09/669,847
DOCKET NO. FQ5-488

25

**"THE PROPOSED MODIFICATION CANNOT RENDER THE
PRIOR ART UNSATISFACTORY FOR ITS INTENDED PURPOSE**

*If the proposed modification would render the prior art invention
being modified unsatisfactory for its intended purpose, then there is no
suggestion or motivation to make the proposed modification." (M.P.E.P. §
2143.01).*

As explained above, the purpose of the Nazanin et al. reference is to remind the user
to place a call to a party at a specific time.

The Examiner alleges that it would have been obvious "to implement the alert
inhibition controller so that it could silence the ringing."

Applicant respectfully submits that the Examiner's proposed modification to "silence
the ringing" would destroy the intended purpose that is disclosed by the Nazanin et al.
reference, which is to remind the user to place a call to a party at a specific time. Applicant
respectfully submits that it is not possible to remind a user to call if the ringer is silenced in
accordance with the Examiner's proposed modification.

Thus, the references would not have been combined.

Even assuming arguendo that one of ordinary skill in the art would have been
motivated to combine these references, the combination would not teach or suggest each and
every element of the claimed invention.

As explained previously, the Nazanin et al. reference does not teach or suggest the
features of the present invention including: 1) calculating an amount of time that has elapsed
since the last-communication time, (claims 1, 8, 11, 21, and 23) and 2) comparing an amount
of time that has elapsed since a last-communication time to a predetermined time interval

09/669,847
DOCKET NO. FQ5-488

26

(claims 1, 8, 11, 18-21, 23, and 25-27).

The Groff reference does not remedy these deficiencies.

Therefore, the Examiner is respectfully requested to withdraw the rejection of claims 11, 13-14, 17, 20, 23-24, and 27.

III. FORMAL MATTERS AND CONCLUSION

In view of the foregoing amendments and remarks, Applicant respectfully submits that claims 1, 4-11, 13-27, and 29-30, all the claims presently pending in the Application, are patentably distinct over the prior art of record and are in condition for allowance. The Examiner is respectfully requested to pass the above application to issue at the earliest possible time.

Should the Examiner find the Application to be other than in condition for allowance, the Examiner is requested to contact the undersigned at the local telephone number listed below to discuss any other changes deemed necessary in a telephonic or personal interview.
